

Active IQ OneCollect

To gather a comprehensive, end-to-end inventory of your SAN environment—from ESXi host initiators to NetApp cluster targets—use **NetApp Active IQ OneCollect**. This tool automates the discovery and collection of host, switch, and storage configurations, generating detailed reports essential for undocumented environments.

If you are specifically using VMware ESXi hosts, you can also leverage **NetApp Virtual Storage Console (VSC)** to discover and map mapped LUNs, initiators, and datastores directly through VMware vCenter.

For additional planning and verification, the NetApp Interoperability Matrix Tool (IMT) provides full component compatibility to ensure your SAN components are properly supported.
