

Active Sync Snapmirror failover

The `snapmirror failover show` command in the [NetApp ONTAP](#) CLI monitors the progress and status of failover operations in a [SnapMirror active sync](#) environment. Executed on the destination cluster, it displays failover progress, error messages, and operation timelines.

The failover commands are used to monitor, plan, or execute your disaster recovery and site maintenance switches:

- **Initiate Failover:** Use [snapmirror failover start](#) to begin the planned failover of a Consistency Group or volume.
- **Monitor Progress:** Use `snapmirror failover show` to check the current [failover status](#) (e.g., in progress, failed, completed).
