

1. In Grid Manager Dashboard

Next to the overview, what other overviews can you get?

2. In Grid Manager Tenants

- Create Tenant that has your name and uses its own identity source

After the Tenant has been created, sign in as root

- Create a Bucket (bucket1) in the default region.

- After you have created the bucket...select the bucket.

What is listed under bucket options? Do you know that these options mean?

- In my access keys

- create access keys and save them in a file

- Go back to buckets.

- select bucket1 and go to the S3console

- Upload your access keys by using the file you just

created...you can simply click Upload access keys

- Upload any file you like into bucket1

3. In Grid Manager ILM

Create a Region -> eu-west-1

Create an ILM rule

- Name ec2_1

- The rule should apply to the tenant with your name

- Via advanced filters

- Make sure that the location constraint is used for eu-west1.

- Via placement options

- You should use erasure coding using 2+1 scheme for datacenter 1 only

- Use Balanced Placement. (what is that again?)

Create a new policy (ec-pol)

- The rules should be the ec2_1

the Default rule should be 1 Copy Per Site
