

Nutanix ecli

```
nutanix@CVM:~$ ecli task.list include_completed=false
```

You should have a return that looks like this:

```
Task UUID Parent Task UUID Component Sequence-id Type Status  
37a430d3-b80b-4ae7-bfaf-9df5247e9ce7 Nutanix Guest Tools 282  
MountGuestTools kQueued
```

Retrieve the UUID of the affected task and type the following command:

```
ergon_update_task -task_uuid='TASK_UUID' -task_status=aborted
```

In my case, that's the command is need to execute:

```
ergon_update_task  
-task_uuid='37a430d3-b80b-4ae7-bfaf-9df5247e9ce7'  
-task_status=aborted
```

This will force the currently running task to be canceled.
